Working with a can do attitude is important in the success of any business, particularly when you are dealing with extreme conditions and challenging situations encountered in the Northern Territory.

This positive attitude has enabled local company Envirotech Monitoring Pty Ltd to take on some interesting projects including securing the role of environmental consultants for Vista Gold on the Mt Todd gold mine project since 2009.

Along with their specialised automated monitoring systems, Envirotech are also responsible for the monitoring and sampling of pit water, groundwater, sediments and macroinvertebrates to ensure that Vista Gold have accurate water quality data on the mine site and the Edith River.

Their work is governed by a number of Australian standards including those for water quality measurement and sampling.

Envirotech have also developed a number of additional processes and procedures which follow industry best practice backed by a thorough understanding of environmental measurement to ensure high quality results.

While Environmental Measurement Engineer, Austin Brandis says that the physical conditions and remoteness of Northern Australia can make environmental measurement challenging, such as crocodile risk when working around surface waters, good planning ensures their work is completed without incident.

Envirotech's strength and success is based on their ability to apply and integrate different technologies, with a thoroughness and a constant strive for perfection in the things they do and deliver.
